EXAMINER

GEORGE, PATRICIA ANN

ART UNIT	PAPER NUMBER
----------	--------------

1765

DATE MAILED: 11/06/2006

Please find below and/or attached an Office communication concerning this application or proceeding.

<b>Office Action Summary</b>	Application No. 10/732,931	Applicant(s) KIM ET AL.	
	Examiner Patricia A. George	Art Unit 1765	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

**Period for Reply**

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

**Status**

- 1) ☒ Responsive to communication(s) filed on 01 September 2006.
- 2a) ☒ This action is **FINAL**.                      2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

**Disposition of Claims**

- 4) ☒ Claim(s) 4-16 is/are pending in the application.
- 4a) Of the above claim(s) \_\_\_\_\_ is/are withdrawn from consideration.
- 5) ☐ Claim(s) \_\_\_\_\_ is/are allowed.
- 6) ☒ Claim(s) 4-16 is/are rejected.
- 7) ☐ Claim(s) \_\_\_\_\_ is/are objected to.
- 8) ☐ Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

**Application Papers**

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on \_\_\_\_\_ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.  
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

**Priority under 35 U.S.C. § 119**

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All    b) ☐ Some \*    c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
  2. ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.
  3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

\* See the attached detailed Office action for a list of the certified copies not received.

***Response to Amendment***

In the amendment, filed on 9/01/2006, applicants provided a Statement of Accuracy of Translation of the Korean application to perfect the claim for foreign priority based on the filing date of the Korean application of December 11, 2002. Accordingly the 35 U.S.C. 103 rejection over Hong has been removed because the present application's foreign priority date predates the publication date of Hong.

***Claim Rejections - 35 USC § 103***

Claims 4, 9, 10, 11, 12, 15 and 16 rejected under 103(a) as being unpatentable over Knorr et al. of USPN 6,531,377 in view of Chen et al. of USPN 6,265,269.

Knorr et al. disclosed a method for providing isolation by depositing anisotropic (ab.) insulative materials between high aspect ratio trenches (col.2, l.43-54).

In figures 2-7 Knorr illustrates forming isolation trenches (111). Knorr illustrates depositing a hard mask layer (114/122) over the substrate (112), using a photo/etch process (col.4, l.3-9), which is written on forming the gap in the substrate through a hard mask thereon prior to forming the first material in the gap, as in claim 4, 11, and 12; and forming a pattern to define a gap on a substrate, as in claims 9 –11; Knorr teaches the hard mask is removed after the insulative fill material is produced and polished by CMP (col.6, l. 7-10), as in claims 11 and 12. After forming the trench in the substrate, Knorr deposits a sidewall oxide (121); a silicon nitride liner (125), which is discussed in col. 4, para. 2-3; Knorr forms a bottom oxide layer on a surface of the substrate substantially filling the gap and etching back the bottom oxide layer inside an

Art Unit: 1765

opening in the gap to expose side walls of the gap so that a residual bottom oxide layer remains at a bottom of the gap and teaches the preferred material for the first insulative layer at the bottom of the gap is an oxide, which illustrates selectively growing the layer (Col.4, line 27), as in claim 9; the first material further comprises avoiding forming the first material on the side wall nearer the opening in the gap, shown in figure 8; and conformably depositing a silicon nitride layer liner on a surface of the substrate including on the side walls of the gap, as in claim 10. Knorr illustrates depositing a top layer such as 130 of figure 7, 230 of figure 9, or 326 of figure 11, and teaches use of an anisotropic HDP-CVD process for one to four (see claims 1-3) insulative fill materials (co.5, para.5), which illustrates selectively depositing a top oxide layer on the residual bottom oxide layer, as in claims 9 and 16.

Knorr discloses an aspect ratio of 3:1 or greater (col.6, l.40), which encompasses the claimed range of the gap depth at least about eight times greater than a width of the gap, as in claim 7.

As to claims 15, Knorr obviousness the first insulating material (116) in a thickness of approximately 300 nanometers, which converts to 3000 angstroms, encompassed by the claimed range of between about 100 Angstroms and about 3600 Angstroms.

Knorr failed to teach the bottom oxide layer “only” at a bottom gap, as in claim 16.

Chen et al. illustrates a bottom insulative oxide layer, only at bottom of gap on front page drawing, and discussion in abstract.

It would have been obvious to one of ordinary skill in the art at the time of invention was made, to modify the invention of providing isolation by depositing anisotropic (ab.) insulative materials between high aspect ratio trenches, as Knorr, by forming the bottom insulative layer only at bottom of the gap, as Chen et al., because Chen et al. teaches forming the lower oxide provide an insulation, which is known to prevent spiking effects (see section *Brief Summary*).

### ***Claim Rejections - 35 USC § 103***

Claims 6, 8, 13, and 14 are rejected under 35 U.S.C. 103(a) as being unpatentable over Knorr and Chen, as applied to claims 4, 9, 10, 11, 12, 15 and 16 above, further in view of Yao of USPN 5,716,890, evidenced by USPN 6,177,698.

Knorr teaches insulative films through HDP CVD processing, does not explicitly teach the use of ozone activated TEOS or the process parameters that might be selected for TEOS deposition, as in claims 6, 8, 13, and 14.

As for claims 6, 8, 13, and 14, Yao teaches a method for fabricating an interlayer, insulating film, which includes HDP CVD deposition that uses ozone (col.4, l.57-60) in a range between 3500 to 6000 sccm (col.4, l.65), which demonstrates "a method wherein the rate of the first rate is about four times greater than the second rate", as evidenced by column 2, lines 54-59, of USPN 6,177,698. Yao teaches a process pressure in a range between about 400 torr and 600 torr (col.4, l.67) which is encompassed by the claimed range of 200 torr and about 760 torr, as in claim 13; introducing a TEOS to the environment at a rate in a range between about 200 and 4000 mg/min (col.5, l.1-2) as in

claim 8; at a temperature in a range between about 360.degree. C. to 440.degree. C. which is encompassed and overlaps the claimed range of 400.degree. C. to 480.degree. C. as in claim 13. Yao does not use the same unit of measurement when teaching the amounts of TEOS and ozone, but Yao teaches very broad ranges for both materials, which appears to overlap a concentration of ozone between 1% and 18% by weight, as in claim 8 and 14.

It would have been obvious to one of ordinary skill in the art at the time of invention was made, to specify the method of forming ozonized TEOS, of Yao, in the invention which discloses a method for high aspect ratio gap filling using HDP-CVD, of Knorr, because Yao teaches an improved structure and process for forming a layer that can fill narrow trenches, provide planar surfaces, have low stress, and good moisture resistance, which improves the reliability of semiconductor devices.

### ***Claim Rejections - 35 USC § 103***

Claim 5 is rejected under 35 U.S.C. 103(a) as being unpatentable over Knorr and Chen, as applied to claims 4, 9, 10, 11, 12, 15 and 16 above, further in view of Hung et al. of USPN 6,190,999.

Knorr failed to teach a method of removing the hard mask from the substrate prior to forming the first material in the gap.

Hung et al. teaches an improved method of STI formation, which includes removing the hard mask from the substrate prior to forming the first material in the gap. See figures 2A through C and column 3, lines 25-30.

It would have been obvious to one of ordinary skill in the art at the time of invention was made, to modified the invention which discloses a method for high aspect ratio gap filling using HDP-CVD, of Knorr, to remove the hard mask before depositing a trench fill, as in Hung, because Hung teaches the an improvement that increases the filling performance and prevents defects and improves adhesion of the subsequent layers which will reduce overall manufacturing cost.

### ***Response to Arguments***

Applicant's arguments filed 9/01/2006 have been fully considered but they are not persuasive.

Applicant's argue, on pages 7, 8, and 9, that the term "growing" (used as a limitation in claims 9 and 160 means: provided via a reaction with the base material (i.e. bottom oxide layer), not by depositing as done with an HPD-CVD, as the reference of Knorr et al. Please reference to applicants' own specification, where the term growing is consistently used to describe the direction of the deposition, and the method in which the additional oxide layer is provided is consistently recited as being deposited.

Examiner can find no definition of the term "growing" within applicants' specification. As applicants' repeated used the term deposited, when referring to the forming of the top oxide layer on the residual bottom layer, examiner maintained applicants' implied definition. Also, the term "growing" is defined as increasing in amount, which the deposition of the top oxide on the residual bottom oxide layer, clearly increases the total

Art Unit: 1765

amount of oxide, therefore the deposition is growing a top oxide (see page 4 of 5, 4 results from growing, dictionary.com, WordNet ® 2.0, © 2003 Princeton University) Since, applicant does not provide a definition of the term "growing" examiner used the definition as provided, which is the same as applicants' implied definition. Also applicant does not provide a negative limitation which would exclude a CVD deposition process. Therefore examiner stands.

As to Applicant's argument, on page 8 and 9, that there is no motivation to combine the reference of Knorr and Chen, because Chen calls for the formation of overhangs that Knorr seeks to avoid. Knorr and Chen both illustrate avoidance of overhang, which each evidence by a step of removing the overhang after the forming of the oxide at the bottom of the trench. See Knorr's figures 3-4, and para. 8-9; and see Chen's figures 2-4, and paragraph 6. Examiner stands that there is motivation to combine the two teachings, because the teaching of Chen explicitly teaches an improvement to the process, wherein that the forming of a oxide at the bottom of the trench provides insulation which prevents spiking.

→ Final res IP

**Conclusion**

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure: Hong et al. of KR 2001-39446, 2001KR-2001-39446, July 3, 2001.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Patricia A. George whose telephone number is
